Uittreksel

PROBLEM TO BE SOLVED: To provide a drum molding apparatus for readily cleaning a rotating drum and a molding part without leaking a food material from the end of the rotating drum.

SOLUTION: This drum molding apparatus comprises the rotating drum (1), the molding part (2) of the food material, a driving part (3) and supporting rollers (4) and (5) and an opening (12) of the rotating drum (1) is detachably equipped with the molding part (2) composed of a female mold member (20) and a male mold bottom member (24). A connection member (32) of the driving means is linked to holes (16) of a flange part (15) of the rotating drum (1) to drive the rotating drum (1). Since the rotating drum (1) is supported on the supporting rollers (4) and (5) and the side plate of a hopper can be pressed against the rotating drum and stuck fast to the rotating drum, a food material will not be leaked from the end of the rotating drum. Since the molding part (2) is detachably installed and driven at the end part of the rotating drum (1), the cleaning, etc., of the molding part can be readily carried out.
